

12 Fuse panel

Thank you for your purchase from Larry's Electric. To help aid in a successful installation, I have included instructions. Please take the time to familiarize your self with all the components and instructions before installing. In addition to the instructions you will need these basic tools a drill, wire cutters, soldering tools, 12 volt test light, and a basic understanding of the proper use of these tools. This fuse panel doesn't have all of the components needed to completely wire your vehicle, in addition you will need (switches, light sockets, wiring, etc.)

- First remove the panel from the box and take a look at the different parts. At this time you will want to determine as to where you will mount the fuse panel.
- Remove the cover labels from the box and hold them along side there proper location and begin to connect your wires.
- Connect each circuit to its proper space on the labels as listed below.

WHEN SPLICING ANY WIRE YOU SHOULD SOLDER IT WITH A ROSIN CORE TYPE SOLDER, THEN COVER IT WITH SHRINK TUBING OR ELECTRICAL TAPE.
